

Choose one of the five common molecules below to research. Your research should include, but not be limited to how each of the molecules is used or found in everyday life. Is it a molecule or compound or both? What elements make up the molecule.? How it is bonded to the other elements in the molecule.? What are the number of valence electrons for each element in the molecule? Is the element negative or positive? What are the characteristics of each element before bonding and the characteristics of the molecule after bonding? You can mix or match the molecules to the presentation styles also listed below.
